

# Kalanchoe

## Care Guide

### Soil

Mixture of sand, peat moss and perlite.

### Watering

Recommend watering once a week. Light drying between waterings is ideal.

### Light Requirements

Kalanchoe is able to handle direct sunlight. Flowers increase in intensity, while leaves may have a reddish glow. A location with indirect sunlight will help to prevent leaves from reddish glow and will help the flowers' color fade a bit.

### Placement

Kalanchoe needs to be placed indoor.
